AI CO-CREATION / NEW DEMO

FROM INTENT TO EDITABLE DESIGN

An explainable, human-reviewed AI briefing prototype

Python 3 • Explainable TF-IDF • Bounded design patch

LinuxONE/s390x target — deployment not yet verified

THE PROBLEM

Creative intent is clear to people, but unclear to systems.

01

AMBIGUOUS INPUT

"A thoughtful gift" rarely includes a usable design brief, scope, or production constraints.

02

SCATTERED DECISIONS

Conversations, concepts, dimensions and supplier notes split across tools and hand-offs.

03

AUTOMATION RISK

A compelling render is not a production specification; human checks remain necessary.

GOAL **Convert a vague request into a reviewable, editable artifact.**

A TRANSPARENT AI PIPELINE

Five steps. No production customer records. No external API dependency.

Human confirms

DESIGN OUTPUT JSON patch + style evidence + mandatory human checks

WORKING CLI DEMONSTRATION

Synthetic request: "Minimal thank-you bottle for a colleague, budget $150."

```
$ python3 app.py --file examples/request.txt
{
  "inferred_occasion": "appreciation",
  "inferred_style": "minimal",
  "estimated_budget_usd": 150,
  "editable_design_patch": {
     "shape": "vessel", "height_ratio": 1.18,
     "waist_indent": 0.12
  },
  "human_review_required": [ ... ]
}
```

LOCALLY VERIFIED

6 / 6

unit tests passed

No LinuxONE execution has been verified yet.

IBM Z / LINUXONE: NEXT STEP

Practical s390x path, without claiming an untested deployment.

01	**PROVISION**	Create LinuxONE Community Cloud VM under SSF2026.
02	**RUN**	Install Python 3 and run the same standalone CLI.
03	**VALIDATE**	Repeat tests, document run logs and latency.
04	**REVIEW**	Use human sign-off before manufacturing handoff.
